TI - DEVICE FOR INDICATING DIRECTION OF TIRE OF VEHICLE

AB - PURPOSE: To prevent wrong operation at starting, by recognizing with eyes how much the direction of a tire is shifted.

- CONSTITUTION: A pendulum 9 always moves vertically downwards due to its weight in response to the turning of a steering wheel 1. At that time, a difference is made between the pendulum 9 and a gear 5 secured on a case 3 fixed on the steering wheel 1 and a transmission gear 6 pivotally coupled to the pendulum is rotated in an apparently fixed position while being engaged with the secured gear 5. Since a pointer gear 11 on a pointer shaft 10 is engaged with the small-diameter teeth 6b of the transmission gear 6, the pointer gear is rotated at a reduced speed so that a pointer 7 mounted on the pointer shaft 10 at the opposite part to the pointer gear is displaced on the direction graduations of a dial 12 at a speed which is appropriately reduced to turn the pointer in the same direction as the steering wheel 1 to indicate the direction angle of a tire.
